Roger Hahn was en route to lecture in Paris, collaborating on a book about the theory of the plasticity of metals, and planning to teach a freshman seminar at Cal on the life of Napoleon Bonaparte when he passed away unexpectedly in New York City on May 30. He was 79.

A professor emeritus in the history department, Hahn devoted half a century of service to the University and helped shape the field of history of science. On campus and at home, he was known for his versatile mind, far-reaching perspective, and the ability to reach across disciplines and bring together disparate realms of ideas.

"He had broad interests; he brought scientists together," said James Casey, a professor of mechanical engineering who once co-taught a course with Hahn on Renaissance engineers and was partnering with him on the book. "He was active right up until the very last minute."

Hahn was born in France on Jan. 5, 1932, but fled with his family to America to escape Nazi persecution when he was 9. Before teaching at Cal, he earned his bachelor's and master's degrees at Harvard University and his Ph.D. at Cornell University.

His ties to Paris and his passion for contextualizing the scientific achievement are evident in his numerous accomplishments, exemplified by his 1971 book *The Anatomy of a Scientific Institution: The Paris Academy of Sciences, 1666-1803*. Hahn, who was fluent in five languages, received the honor *Officier de l'Ordre des Palmes*

Académiques in 1977 for promoting cultural exchange between France and America.

When he took his family traveling around Western Europe, the first thing he would do upon getting off the plane was to find a library and see if they had any documents relating to his research, said Elisabeth, the elder of his two daughters. "He was deeply, deeply devoted" to both teaching and family, she said. "He loved learning, and he loved sharing that."

Hahn's fascination with history was "almost genetic," said younger daughter Sophie '83, who majored in her father's department at Cal while he was still teaching. Hahn's hobby was working on an extensive database of family genealogy, which included more than 15,000 relatives.

Above all, friends and family say, Hahn worked tirelessly to enrich the minds of the Cal community.

"He was an incredibly pure human being," said Ellen, his wife of more than 50 years, who resides in Berkeley. "He absolutely loved being here. Every single day he would say, 'Aren't we lucky that we landed here?' He was very grateful for the opportunities that the university offered him."

Keith Walton Tantlinger '41 died at home in Escondido on Aug. 27 at the age of 92. He is best known for having invented the key technology for the modern shipping container—an innovation widely credited with making globalization possible.

Born in Orange on March 22, 1919, and raised in Tustin, Tantlinger was the youngest of six children of a citrus farmer. After receiving his bachelor's degree in mechanical engineering, he joined the Douglas Aircraft Company during World War II, where he designed the tools used to manufacture B-17 bombers. Following the war, he went to work at Brown Trailers, a truck trailer manufacturer, in Spokane, WA.

The event that led to his most famous invention came about in 1955 when Tantlinger, by then vice president of engineering at Brown Industries, was approached by trucking tycoon Malcolm McLean. McLean was looking for a way to speed up the process of stacking containers onto ships. Tantlinger designed the various gadgets, including the crucial twist lock, that allowed containers to be locked on top of one another high on ships and rapidly transported on and off one at a time using a crane, rather than having individual bags, barrels, and boxes heaved by dockworkers on and off ships.

It wasn't until the mid-'60s, though, that Tantlinger's innovation became the international standard. Worldwide, large quantities of goods could now be shipped for a fraction of the cost.

Haas School of Business alumnus William Villalon, MBA '79, vice president at global transport management firm APL Logistics, says, "Tantlinger's innovation is the basis of world trade today.... A single vessel can carry as much as \$600,000,000 worth of cargo in a single sailing. It is safe to say that life as we know it today would not be possible without the ocean container."

In 2009, the National Academy of Sciences awarded Tantlinger with the Gibbs Brothers Medal, "For his visionary and innovative design of the cellular container ship and supporting systems that transformed the world's shipping fleet and facilitated the rapid expansion of global trade."

Marc Levinson, author of *The Box: How the Shipping Container Made the World Smaller and the World Economy Bigger*, talked to Tantlinger in 2002 while researching his book. "This was a man who got a lot of pleasure solving difficult problems," he said by phone. "This inventiveness was in his blood."

Tantlinger continued to invent throughout his life, eventually amassing more than 70 United States patents all relating to transportation, such as a Y-shaped handrail for transit vehicles and an improved design for flat-bed trailers. Some of his other work can be found in the basic structure of cars for the Bay Area Rapid Transit and Washington Metropolitan Area Transit Authority. He also held positions at Fruehauf Corporation in Detroit and Rohr Industries in Chula Vista. After retirement he started a transportation consulting company, Tantlinger Engineering, which he kept up until shortly before his death.

Tantlinger is survived by his second wife, Wanda Gunnel Delinger, a daughter from an earlier marriage, a stepson, and two grandchildren.
